Corporate Mental Wellness & Counseling Platform

Deliverable 1: Requirements Table

Problem Statement #14 — Healthcare & Telemedicine | PES University, Dept. of CSE

Overview: An anonymous enterprise counseling portal that lets employees assess stress levels, book confidential sessions with licensed therapists, and track personal wellness indicators without disclosing their identity to the employer or therapist beyond the platform's anonymized workflow.

A. Functional Requirements (exactly five)

ID	Type	Description	Priority	Acceptance Criteria	Rationale
FR-001	Functional	The system shall generate an anonymized pseudo-ID for each employee account and use it for counseling bookings, so the therapist does not see the employee's corporate email or employee ID.	High	Pass: therapist-facing booking details show only the pseudo-ID and do not expose corporate email or employee ID. Fail: either identifier appears in therapist-facing booking metadata.	Anonymized identifiers help protect employee identity and encourage confidential use of the platform.
FR-002	Functional	The system shall allow a corporate employee to assess and record their current stress level through a wellness assessment.	High	Pass: an employee can submit a stress assessment and receives confirmation that it was saved. Fail: submission is rejected without explanation or the result is not saved.	Stress assessment gives employees a simple way to check in with their well-being.
FR-003	Functional	The system shall allow a corporate employee to view available licensed therapists, select an available appointment slot, and book a confidential counseling session.	High	Pass: a valid available slot can be booked and a confirmation is shown. Fail: the system accepts an unavailable slot or does not confirm a successful booking.	Booking is a core platform capability that connects employees with professional support.
FR-004	Functional	The system shall allow licensed therapists to view their assigned appointments and the employee pseudo-ID, without showing the employee's corporate email or employee ID.	High	Pass: the therapist can view assigned appointments and pseudo-IDs only. Fail: appointment access is unavailable or employee corporate identity is exposed.	Therapists need appointment information to manage sessions while preserving employee confidentiality.
FR-005	Functional	The system shall allow employees to record and view personal wellness indicators over time.	Medium	Pass: the employee can save a wellness entry and retrieve previous entries in chronological order. Fail: an entry is not saved or prior entries cannot be retrieved.	Tracking personal indicators supports reflection on changes in wellness over time.

B. Non-Functional Requirements (exactly two)

ID	Type	Description	Priority	Acceptance Criteria	Rationale
NFR-001	Performance & Security	The appointment scheduler shall convert appointment times accurately across supported global office time zones and remain responsive under expected peak usage.	High	Pass: automated tests confirm correct conversion for selected time zones, daylight-saving transitions where applicable, and the agreed response-time target under the defined load test. Fail: an appointment time is displayed incorrectly or the agreed performance target is missed.	Employees and therapists may be in different office locations; correct time conversion and responsive scheduling prevent missed appointments.

ID	Type	Description	Priority	Acceptance Criteria	Rationale
NFR-002	Security & Privacy	The system shall protect counseling and wellness information from unauthorized access or disclosure and shall minimize identity information shown to therapists and employers.	High	Pass: access-control tests prevent unauthorized access; therapist-facing views omit corporate email and employee ID; data is transmitted over HTTPS in deployment. Fail: unauthorized users can access records or protected identity details are exposed.	Counseling and wellness records are sensitive. Privacy safeguards are necessary to protect users and build trust.

Note: Response-time and load targets should be agreed with the instructor/team and made numeric before formal performance testing. This document is a proposed requirements draft based on the supplied problem statement.
